1.2. First-Order Linear ODE

Equations of the form $\frac{dy}{dx} + \alpha(x)y = \beta(x)$ can be solved by multiplying both sides by an integrating factor $e^{\int \alpha(x)dx}$. Then the left-hand side becomes $\frac{d(e^{\int \alpha(x)dx} \cdot y)}{dx}$ and the right hand side becomes $e^{\int \alpha(x)dx} \beta(x)$. The left and right hand sides can then be integrated directly.

2. Continuum Flow

$$\frac{\partial \rho}{\partial t} + \frac{\partial (\rho v_j)}{\partial x_j} = 0$$

$$\frac{\partial \rho}{\partial t} + \frac{\partial(\rho v_1)}{\partial x_1} + \frac{\partial(\rho v_2)}{\partial x_2} + \frac{\partial(\rho v_3)}{\partial x_3} = 0$$

3. Vorticity Dynamics

$$\text{Circulation } \Gamma = \oint_C \vec{v} \cdot d\vec{l} = \int_S \vec{\omega} \cdot \hat{n} dA \text{ (Flux of Vorticity across surface } S)$$

$$\text{Average angular velocity } \bar{\Omega} = \frac{\bar{u}_\theta}{a} = \frac{\oint_C \vec{v} \cdot d\vec{l}}{2\pi a^2} = \frac{\Gamma}{2\pi a^2} \text{ (On a circle of radius } a) = \frac{\omega_j n_j}{2}$$

For Irrotational Flow, $\Gamma = 0$, $\vec{\omega} = 0$

A vector field $\vec{\alpha}$ is considered solenoidal if $\vec{\nabla} \cdot \vec{\alpha} = 0$

$$\vec{\nabla} \cdot \vec{\omega} = \vec{\nabla} \cdot (\vec{\nabla} \times \vec{v}) = 0$$

$$\text{Equations for Vortex Lines (Cartesian Coordinates)} \quad \frac{dx}{\omega_x} = \frac{dy}{\omega_y} = \frac{dz}{\omega_z}$$

3.2. Terms

- **Barotropic:** Density is a function of pressure only. $\frac{1}{\rho^2} \vec{\nabla} \rho \times \vec{\nabla} p = 0$
- **Inviscid:** Viscosity can be neglected. $\nu \nabla^2 \vec{\omega} = 0$
- **Baroclinic:** Measure of how misaligned the gradient of pressure is from the gradient of density in a fluid $\vec{\nabla} \rho \times \vec{\nabla} p$
- **Isobars:** Constant pressure lines
- **Isopycals:** Constant density lines

3.3. Vorticity Transport Equation

$$\frac{D\vec{\omega}}{Dt} = (\vec{\omega} \cdot \vec{\nabla}) \vec{v} + \frac{1}{\rho^2} \vec{\nabla} \rho \times \vec{\nabla} p + \nu \nabla^2 \vec{\omega}$$

$$\frac{\partial \vec{\omega}}{\partial t} + (\vec{v} \cdot \vec{\nabla}) \vec{\omega} = (\vec{\omega} \cdot \vec{\nabla}) \vec{v} + \frac{1}{\rho^2} \vec{\nabla} \rho \times \vec{\nabla} p + \nu \nabla^2 \vec{\omega}$$

Legend

- $\frac{D\vec{\omega}}{Dt}$: Total rate of change of vorticity of a fluid particle
- $(\vec{\omega} \cdot \vec{\nabla}) \vec{v}$: Vorticity production due to stretching/tilting of vortex lines

- $\frac{1}{\rho^2} \vec{\nabla} \rho \times \vec{\nabla} p$: Vorticity production due to baroclinic effects
- $\nu \nabla^2 \vec{\omega}$: Viscous diffusion of vorticity which dissipates or redistributes vorticity

3.4. Helmholtz's Vortex Theorems for Inviscid Flows

Assumptions

- Inviscid
- Barotropic
- Conservative Body Forces $\vec{F} = -\vec{\nabla} \psi$

Statement

- Fluid particles/element originally free of vorticity remain free of vorticity (non-rotating)
- Vortex lines (tubes) move with the fluid for inviscid flows. Vortex line is always comprised of the same fluid particles (Vorticity is frozen to the flow for inviscid flow)
- The strength of the vortex tube (circulation) does not vary with time during the fluid motion. Vortex tubes must be closed, go to infinity, or end on solid boundaries.

3.5. Kelvin's circulation theorem

Assumptions

- Inviscid
- Barotropic
- Incompressible
- Conservative Body Forces $\vec{F} = -\vec{\nabla} \psi$

Statement

The circulation (strength of the vortex) around a closed curve moving with the fluid will remain constant.

$$\frac{\partial \Gamma_C}{\partial t} + v_j \frac{\partial \Gamma_C}{\partial x_j} = \oint_C \nu \nabla^2 \vec{v} \cdot d\vec{x}$$

For inviscid flow, $\frac{\partial \Gamma_C}{\partial t} + v_j \frac{\partial \Gamma_C}{\partial x_j} = 0$

3.6. Bernoulli's Equation

Assumptions

- Inviscid $\nabla^2 v = 0 \rightarrow$ Euler
- Only gravitational body forces (Conservative) $\rightarrow f_i = -\frac{d\psi}{dx_i}$ where $\psi = gz$

- Barotropic $\rightarrow \rho = \rho(p)$
- Steady flow $\rightarrow \frac{\partial}{\partial t} = 0$

Note: No restriction on the compressibility effects

Statement

$$\nabla \left[\frac{\vec{v} \cdot \vec{v}}{2} + gz + \int \frac{dp}{\rho} \right] = -\vec{\omega} \times \vec{v}$$

Along streamline or vortex line $\frac{\vec{v} \cdot \vec{v}}{2} + gz + \int \frac{dp}{\rho} = \text{constant}$

Unsteady flow $\frac{\partial \phi}{\partial t} + \frac{\vec{v} \cdot \vec{v}}{2} + gz + \int \frac{dp}{\rho} = F(t)$

Steady Potential flow $\frac{\vec{v} \cdot \vec{v}}{2} + gz + \int \frac{dp}{\rho} = \text{constant throughout the flow}$

$$x = r \cos \theta$$

$$y = r \sin \theta$$

$$r = \sqrt{x^2 + y^2} = |z| = |z\bar{z}|^{\frac{1}{2}}$$

$$\theta = \arctan \frac{y}{x}$$

2D Incompressible Potential Flow $\nabla^2 \phi = 0 = \nabla^2 \psi$

Complex Potential $F(z) = \phi(z) + i\psi(z)$
